Security engineer focused on multiplying what security teams can do—through operational platforms, automation, and AI/agentic systems adopted org-wide. I translate fuzzy operational problems into durable tooling, establish the standards and patterns teams build on, and influence how AI gets embedded into day-to-day security operations.

Experience

Amazon
Security Engineer II - Washington, D.C.
May 2025 - Present

- Co-built and shipped an automated AI triage agent that dispositions security cases on arrival—collecting logs, gathering detection context and IOCs, and making determinations—reaching ~96% correct disposition on complex non-perimeter detections (1,914 of 2,000) and saving over 2,300 analyst investigation hours since February across perimeter and non-perimeter alerts.
- Unified 15 services across 13 distinct auth mechanisms (IAM/STS role assumption, OAuth, service-to-service credentials, and bespoke per-service schemes) behind a config-driven Python authentication library and proxy API for the global security organization, with one interface that behaves identically across local, deployed, and user/service contexts. Designed to be agent-introspectable so an AI agent or engineer can discover available capabilities and self-serve, it has been adopted by 5 teams across more than a dozen projects—including teams with their own API client libraries—because it collapses an onboarding path that previously took weeks of setup plus 6–12 months of internal-tooling ramp into a same-day, self-serve experience.
- Automated the majority of detection onboarding—a historically complex, error-prone process—with an AI agent that takes the workflow from hours to minutes (roughly 90% hands-off), eliminating missed steps and becoming a critical, standard part of the team's onboarding process.
- Introduced collaborative development to a platform that did not support it, designing and building a CLI that provisions isolated user workspaces so engineers no longer overwrite each other's work, with a built-in AI agent that guides users to author automations that are scalable and secure by default, including secrets management out of the box.
- Rebuilt an antiquated, quality-control-free automation system into a governed development pipeline with code formatting, automated testing, and full auditability—surfacing silently-failing workflows that had been broken for months and generating documentation for leadership that reduced the number of people needing direct platform access to perform audits.

Rapid7
Senior Software Engineer - Remote
Jan 2023 - May 2025

- Deployed and maintained Timesketch, open source collaborative

Skills

DevOps
- Infrastructure as Code
- CI/CD Pipelines
- Cloud Systems

Security Engineering
- Incident Response Automation
- Alert Automation
- Detection and Response
- AI/Agentic Workflows

Software Engineering
- Event Driven Services
- Peer Review and Feedback
- Unit/Integration Testing
- Microservice Architecture
- Serverless Architecture

Soft Skills
- Project Planning/Review
- Cross Team Collaboration
- Post Mortem Reporting
- Mentoring
- Documentation

Technologies

AWS
- ECS
- Lambda
- SNS
- SQS
- EventBridge
- SES
- Batch
- API Gateway

Infrastructure as Code
- Terraform
- Ansible

CI/CD
- Jenkins
- Github Actions
- pre-commit

Containers
- Docker
- Docker Compose

Programming Languages
- Python
- GoLang
- Bash
- Javascript

forensic analysis tool, for incident response allowing for easier hand-offs and greater investigation efficiency in a globally distributed remote incident response service.
- Designed and developed an end-to-end forensic pipeline for incident response engagements, allowing analysts to retrieve, parse, and analyze datasets on the order of 100's of millions of records. This saved the organization thousands of hours of manual incident response work.
- Developed a python library to extend Django REST Framework capabilities allowing our team to move to an event driven architecture and perform security and customer management automations on any API event in our environment.
- Created and implemented a Django REST Framework permission class, allowing us to expose internal APIs to external teams whilst providing the business control over which users and groups have access to modify critical operational information.
- Collaborated with several customer facing teams to develop a customer management system, resulting in unifying customer management across three different managed services.
- Migrated a legacy python library to a new one by creating unit and integration tests, allowing us to transition to a new service without any downtime.
- Developed a collaborative data science platform in the cloud using JupyterHub and AWS.

Software Engineer II - Arlington, VA
Jan 2021 - Jan 2023

- Sole technical contributor supporting the decision to acquire the forensics-at-scale tool, Velociraptor, by prototyping the integration into the Rapid7 Insight agent, building the foundation for the remote incident response service. Ultimately leading to the acquisition and marketability of Velociraptor as a line-item SKU of the Rapid7 software stack.
- Developed automation to improve incident management, tracking and communication between analysts, customer advisors, external customers and the business through integration with various external services such as Slack, Salesforce and Jira.
- Automated the monthly delivery of key customer status and security reports for managed services, saving analysts over 500 hours of manual report writing each month to deliver the reports to customers and improving the customer experience with increased consistency of delivery times.

Software Engineer I
Feb 2020 - Jan 2021

Associate MDR Analyst
Nov 2018 - Jan 2020

Education

Frederick Community College - *Information Security and Assurance Certificate*

API Technologies
- REST
- GraphQL
- gRPC

Databases
- PostgreSQL
- Redis
- Dynamodb
- Mongo
- OpenSearch

Testing
- Django Tests
- Pytest
- Python Unit Tests

Other
- Velociraptor
- AWS Lambda Powertools
- Terraform AWS Modules
- Timesketch
- Plaso Tools
